Global Disclaimer

This document serves as a disclaimer for the crypto smart contract audit conducted by Skeleton Ecosystem. The purpose of the audit was to review the codebase of the smart contracts for potential vulnerabilities and issues. It is important to note the following:

Limited Scope: The audit is based on the code and information available up to the audit completion date. It does not cover external factors, system interactions, or changes made after the audit. The audit itself can not guarantee 100% safaty and can not detect common scam methods like farming and developer sell-out.

No Guarantee of Security: While we have taken reasonable steps to identify vulnerabilities, it is impossible to guarantee the complete absence of security risks or issues. The audit report provides an assessment of the contract's security as of the audit date.

Continued Development: Smart contracts and blockchain technology are evolving fields. Updates, forks, or changes to the contract post-audit may introduce new risks that were not present during the audit.

Third-party Code: If the smart contract relies on third-party libraries or code, those components were not thoroughly audited unless explicitly stated. Security of these dependencies is the responsibility of their respective developers.

Non-Exhaustive Testing: The audit involved automated analysis, manual review, and testing under controlled conditions. It is possible that certain vulnerabilities or issues may not have been identified.

Risk Evaluation: The audit report includes a risk assessment for identified vulnerabilities. It is recommended that the development team carefully reviews and addresses these risks to mitigate potential exploits.

Not Financial Advice: This audit report is not intended as financial or investment advice. Decisions regarding the use, deployment, or investment in the smart contract should be made based on a comprehensive assessment of the associated risks.

By accessing and using this audit report, you acknowledge and agree to the limitations outlined above. Skeleton Ecosystem and its auditors shall not be held liable for any direct or indirect damages resulting from the use of the audit report or the smart contract itself.

Please consult with legal, technical, and financial professionals before making any decisions related to the smart contract.

Overview

Contract Name	Staffy
Ticker/Simbol	STAFFY
Blockchain	Binance Smart Chain BEP20
Contract Address	0xE9BD7F1a2bc7De2fb999bA568D9adddB50A15e02
Creator Address	0xd3eE51c64461DFA8644e2c358D521f7bC7e3DF10
Current Owner Address	0x0000000000000000000000000000000000000000
Contract Explorer	https://bscscan.com/address/0xE9BD7F1a2bc7De2fb999bA568D9adddB50A15e02#code
Compiler Version	v0.8.19+commit.7dd6d404
License	MIT
Optimisation	Yes with 200 Runs
Total Supply	222,000,000,000,000,000 **STAFFY**
Decimals	9

Creation/Audit

Contract Deployed	17.03.2024
Audit Created	28.03.2024
Audit Update	V 1.0

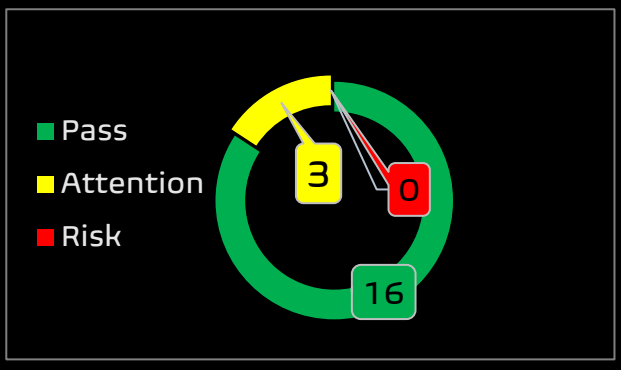
SKELETON ECOSYSTEM
SMART CONTRACT AUDIT REPORT

STAFFY BEP20



Contract Function Analysis

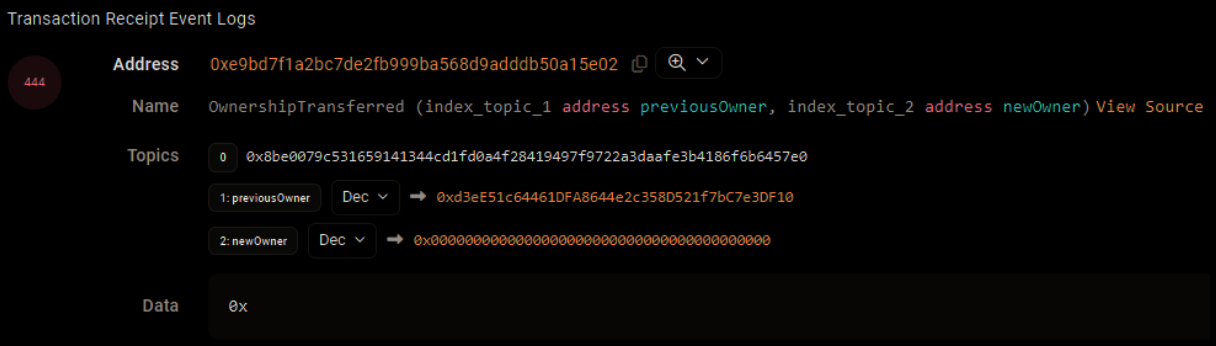
✅ Pass ⚠ Attention Item ❗ Risky Item

Contract Verified	✅	The contract source code is uploaded to blockchain explorer and is open source, so everybody can read it.
Contract Ownership		0x0000000000000000000000000000000000000000 Sometimes referred to as the "zero address" or "dead address" and is not owned by anyone.
Buy Tax	7 %	Shows the taxes for purchase transactions. Above 10% may be considered a high tax rate. More than 50% tax rate means may not be tradable. Fee can be set!
Sell Tax	10 %	Shows the taxes for sell transactions. Above 10% may be considered a high tax rate. More than 50% tax rate means may not be tradable. Fee can be set!
Honeypot Analyse	✅	Holder is able to buy and sell. If honeypot: The contract blocks sell transfer from holder wallet. Multiple events may cause honeypot. Trading disabled, extremely high tax
Liqudity Status	✅	Liqudity status on 28.03.2024 Lp Locked: 83.97% Pinklock for *82 days.*
Trading Disable Functions	✅	No Trading suspendable function found. If a suspendable code is included, the token maybe neither be bought or sold (honeypot risk). If contract is renounced this function can't be used
Set Fees function	⚠	Fee Setting function found. Contract renounced, function can not be triggered by owner. The contract owner may contain the authority to modify the transaction tax. If the transaction tax is increased to more than 49%, the tokens may not be able to be traded (honeypot risk).
Proxy Contract	✅	Not a Proxy contract
Mint Function	✅	No Mint Function detected Mint function is transparent or non-existent. Hidden mint functions may increase the amount of tokens in circulation and effect the price of the token. Owner can mint new tokens and sell.

Balance Modifier Function		No Balance Modifier function found. If there is a function for this, the contract owner can have the authority to modify the balance of tokens at other addresses. For example revoke the bought tokens from the holders wallet. Common form of scam: You buy the token, but it's disappearing from your wallet.
Blacklist Function		No Blacklist Setting function found. If there is a blacklist, some addresses may not be able to trade normally. Example: you buy the token and right after your Wallet getting blacklisted. Like so you will be unable to sell. Honeypot Risk.
Whitelist Function		Whitelist Setting function found Contract renounced, function can not be triggered by owner. If there is a function for this Developer can set zero fee or no max wallet size for adresses (for example team wallets can trade without fee. Can cause farming)
Hidden Owner Analysis		No Hidden or multi owner with authorisation For contract with a hidden owner, developer can still manipulate the contract even if the ownership has been abandoned.
Retrieve Ownership Function		No Functions found which can retrieve ownership of the contract. If this function exists, it is possible for the project owner to regain ownership even after relinquishing it. Also known as fake renounce.
Self Destruct Function		No Self Destruct function found. If this function exists and is triggered, the contract will be destroyed, all functions will be unavailable, and all related assets will be erased.
Specific Tax Changing Function		No Specific Tax Changing Functions found. If it exists, the contract owner may set a very outrageous tax rate for assigned address to block it from trading. Can assign all wallets at once!
Trading Cooldown Function		No Trading Cooldown Function found. If there is a trading cooldown function, the user will not be able to sell the token within a certain time or block after buying. Like a temporary honeypot.
Max Transaction and Holding Modify Function		Max Transaction and Holding Modify function found. Contract renounced, function can not be triggered by owner. If there is a function for this, the maximum trading amount or maximum position can be modified. Can cause honeypot
Transaction Limiting Function		No Transaction Limiter Function Found. The number of overall token transactions may be limited (honeypot risk)

Details of Risk - Attention Items

Removing Risk of contract function based on renounced ownership



Following detected contract functions serve as informational purposes about the contract. The owner has no more authorisation to trigger the following functions.

⚠ Set Fee 15% Max

Contract renounced, function can not be triggered by owner.

The contract owner may contain the authority to modify the transaction tax. If the transaction tax is increased to more than 49%, the tokens may not be able to be traded (honeypot risk).

```
ftrace | funcSig
590  function updateBuyFees(uint256 _liquidityFeeOnBuy↑, uint256 _marketingFeeOnBuy↑) external onlyOwner {
591      liquidityFeeOnBuy = _liquidityFeeOnBuy↑;
592      marketingFeeOnBuy = _marketingFeeOnBuy↑;
593
594      _totalFeesOnBuy   = liquidityFeeOnBuy + marketingFeeOnBuy;
595
596      require(_totalFeesOnBuy <= maxFee, "Total Fees cannot exceed the maximum");
597
598      emit UpdateBuyFees(liquidityFeeOnBuy, marketingFeeOnBuy);
599  }
600
ftrace | funcSig
601  function updateSellFees(uint256 _liquidityFeeOnSell↑, uint256 _marketingFeeOnSell↑) external onlyOwner {
602      liquidityFeeOnSell = _liquidityFeeOnSell↑;
603      marketingFeeOnSell = _marketingFeeOnSell↑;
604
605      _totalFeesOnSell   = liquidityFeeOnSell + marketingFeeOnSell;
606
607      require(_totalFeesOnSell <= maxFee, "Total Fees cannot exceed the maximum");
608
609      emit UpdateSellFees(liquidityFeeOnSell, marketingFeeOnSell);
610  }
611
```

⚠ Whitelist

Contract renounced, function can not be triggered by owner.

If there is a function for this Developer can set zero fee or no max wallet size for adresses (for example team wallets can trade without fee. Can cause farming)

```
ftrace | funcSig
function excludeFromMaxWallet(address account, bool exclude) external onlyOwner {
    require( _isExcludedFromMaxWalletLimit[account] != exclude,"Account is already set to that state");
    require(account != address(this), "Can't set this address.");

    _isExcludedFromMaxWalletLimit[account] = exclude;

    emit ExcludedFromMaxWalletLimit(account, exclude);
}
```

```
ftrace | funcSig
function excludeFromMaxTransactionLimit(address account, bool exclude) external onlyOwner {
    require( _isExcludedFromMaxTxLimit[account] != exclude, "Account is already set to that state");
    require(account != address(this), "Can't set this address.");

    _isExcludedFromMaxTxLimit[account] = exclude;

    emit ExcludedFromMaxTransactionLimit(account, exclude);
}
```

⚠ Max Transaction and Holding Modify Function

[Min 1%]

Contract renounced, function can not be triggered by owner.

If there is a function for this, the maximum trading amount or maximum position can be modified. Can cause honeypot

```
ftrace | funcSig
function setMaxTransactionAmounts(uint256 _maxTransactionAmountBuy, uint256 _maxTransactionAmountSell) external onlyOwner {
    require(
        _maxTransactionAmountBuy  >= (totalSupply() / (10 ** decimals())) / 1_000 &&
        _maxTransactionAmountSell >= (totalSupply() / (10 ** decimals())) / 1_000,
        "Max Transaction limis cannot be lower than 0.1% of total supply"
    );
    maxTransactionAmountBuy  = _maxTransactionAmountBuy  * (10 ** decimals());
    maxTransactionAmountSell = _maxTransactionAmountSell * (10 ** decimals());

    emit MaxTransactionLimitAmountChanged(maxTransactionAmountBuy, maxTransactionAmountSell);
}
```

```
ftrace | funcSig
function setMaxWalletAmount(uint256 _maxWalletAmount) external onlyOwner {
    require(_maxWalletAmount >= (totalSupply() / (10 ** decimals())) / 100, "Max wallet percentage cannot be lower than 1%");
    maxWalletAmount = _maxWalletAmount * (10 ** decimals());

    emit MaxWalletLimitAmountChanged(maxWalletAmount);
}
```

Contract Security

Total Findings: 4

High 0

Medium 0

Low 3

Info 1

High Severity Issues: High possibility to cause problems, need to be resolved.

Medium Severity Issue: Will likely cause problems, recommended to resolve.

Low Severity Issues: Won't cause problems, but for improvement purposes could be adjusted.

Informational Severity Issues: Not harmful in any way, information for the developer team.

Detected High and Medium Severity Vulnerability Description.

✅ No High or Medium Severity Vulnerability Issues found.

⚠️ Approve Front running Attack (2)

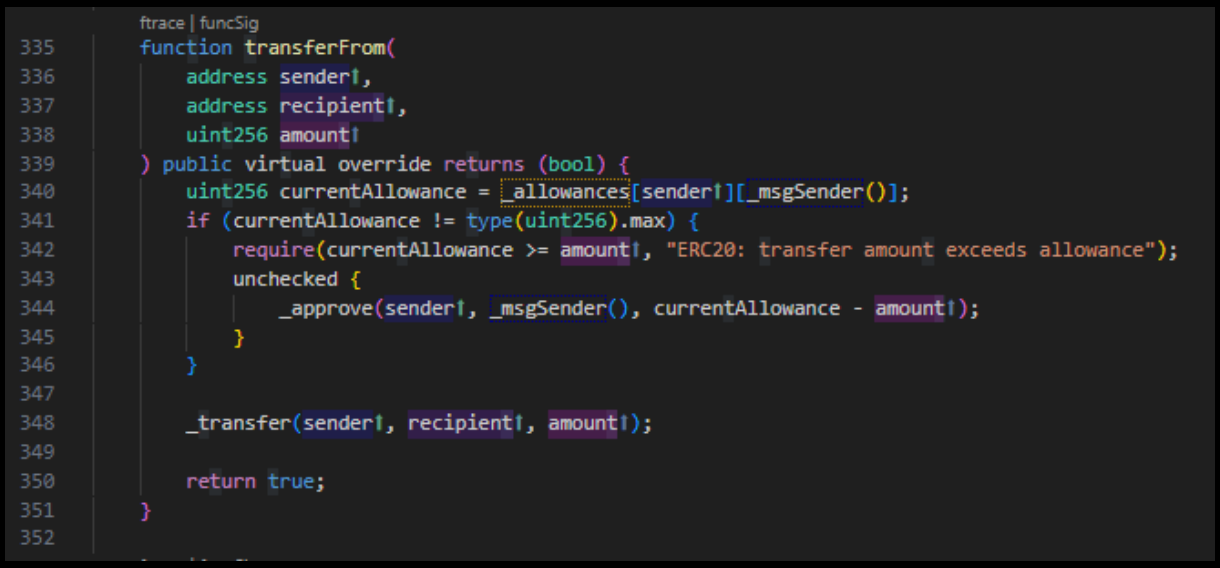
Item: 1	Location:	Line 330-333	Severity:	Low

Function	The approve() method overrides current allowance regardless of whether the spender already used it or not, so there is no way to increase or decrease allowance by a certain value atomically unless the token owner is a smart contract, not an account. This can be abused by a token receiver when they try to withdraw certain tokens from the sender's account. Meanwhile, if the sender decides to change the amount and sends another approve transaction, the receiver can notice this transaction before it's mined and can extract tokens from both the transactions, therefore, ending up with tokens from both the transactions. This is a front-running attack affecting the ERC20 Approve function. The function approve can be front-run by abusing the _approve function.
Remedation	1. Introduce mechanisms that limit the maximum acceptable gas price for transactions. This can help prevent front-runners from drastically increasing the gas fees to prioritize their transactions. 2. Use transaction taxes to prevent against front-run attack

```
ftrace | funcSig
330     function approve(address spender, uint256 amount) public virtual override returns (bool) {
331         _approve(_msgSender(), spender, amount);
332         return true;
333     }
334
```

Item: 2	Location:	Line 335-351	Severity:	Low

Function	The transferFrom() method overrides current allowance regardless of whether the spender already used it or not, so there is no way to increase or decrease allowance by a certain value atomically unless the token owner is a smart contract, not an account. This can be abused by a token receiver when they try to withdraw certain tokens from the sender's account. Meanwhile, if the sender decides to change the amount and sends another approve transaction, the receiver can notice this transaction before it's mined and can extract tokens from both the transactions, therefore, ending up with tokens from both the transactions. This is a front-running attack affecting the ERC20 Approve function. The function approve can be front-run by abusing the _approve function.
Remedation	1. Introduce mechanisms that limit the maximum acceptable gas price for transactions. This can help prevent front-runners from drastically increasing the gas fees to prioritize their transactions. 2. Use transaction taxes to prevent against front-run attack



```
ftrace | funcSig
335     function transferFrom(
336         address sender,
337         address recipient,
338         uint256 amount
339     ) public virtual override returns (bool) {
340         uint256 currentAllowance = _allowances[sender][_msgSender()];
341         if (currentAllowance != type(uint256).max) {
342             require(currentAllowance >= amount, "ERC20: transfer amount exceeds allowance");
343             unchecked {
344                 _approve(sender, _msgSender(), currentAllowance - amount);
345             }
346         }
347
348         _transfer(sender, recipient, amount);
349
350         return true;
351     }
352
```

⚠ Outdated Compiler Version (1 Item)

Item: 1	Location:	Line 11	Severity:	Low

Function	Using an outdated compiler version can be problematic especially if there are publicly disclosed bugs and issues that affect the current compiler version. The following outdated versions were detected: /porkbnb.sol - 0.8.10
Remedation	It is recommended to use a recent version of the Solidity compiler that should not be the most recent version, and it should not be an outdated version as well. Using very old versions of Solidity prevents the benefits of bug fixes and newer security checks. Consider using the solidity version v0.8.23, which patches most solidity vulnerabilities.

```
10
11  pragma solidity 0.8.10;
12
```

Audit Scope

Audit Method.

Our smart contract audit is an extensive methodical examination and analysis of the smart contract's code that is used to interact with the blockchain. Goal: discover errors, issues and security vulnaribilities in the code. Findings getting reported and improvements getting suggested.

Automatic and Manual Review
We are using automated tools to scan functions and weeknesses of the contract. Transfers, integer over-undeflow checks such as all CWE events.

Tools we use:
Visual Studio Code
CWE
SWC
Solidity Scan
SVD

In manual code review our auditor looking at source code and performing line by line examination. This method helps to clarify developer's coding decisions and business logic.
