Global Disclaimer

This document serves as a disclaimer for the crypto smart contract audit conducted by Skeleton Ecosystem. The purpose of the audit was to review the codebase of the smart contracts for potential vulnerabilities and issues. It is important to note the following:

Limited Scope: The audit is based on the code and information available up to the audit completion date. It does not cover external factors, system interactions, or changes made after the audit. The audit itself can not guarantee 100% safety and can not detect common scam methods like farming and developer sell-out.

No Guarantee of Security: While we have taken reasonable steps to identify vulnerabilities, it is impossible to guarantee the complete absence of security risks or issues. The audit report provides an assessment of the contract's security as of the audit date.

Continued Development: Smart contracts and blockchain technology are evolving fields. Updates, forks, or changes to the contract post-audit may introduce new risks that were not present during the audit.

Third-party Code: If the smart contract relies on third-party libraries or code, those components were not thoroughly audited unless explicitly stated. Security of these dependencies is the responsibility of their respective developers.

Non-Exhaustive Testing: The audit involved automated analysis, manual review, and testing under controlled conditions. It is possible that certain vulnerabilities or issues may not have been identified.

Risk Evaluation: The audit report includes a risk assessment for identified vulnerabilities. It is recommended that the development team carefully reviews and addresses these risks to mitigate potential exploits.

Not Financial Advice: This audit report is not intended as financial or investment advice. Decisions regarding the use, deployment, or investment in the smart contract should be made based on a comprehensive assessment of the associated risks.

By accessing and using this audit report, you acknowledge and agree to the limitations outlined above. Skeleton Ecosystem and its auditors shall not be held liable for any direct or indirect damages resulting from the use of the audit report or the smart contract itself.

Please consult with legal, technical, and financial professionals before making any decisions related to the smart contract.

Overview

Contract Name	SQUIBONK
Ticker/Symbol	SQUIBONK
Blockchain	Binance Smart Chain BEP20
Contract Address	0xEc9E63221C995160D05a7954b335fFe4B8CF8b34
Creator Address	0xc21686914d3d28c50Ebd6948CC07B65B2f6dd650
Current Owner Address	0x00
Contract Explorer	https://bscscan.com/token/0xEc9E63221C995160D05a7954b335fFe4B8CF8b34#code
Compiler Version	v0.8.19+commit.7dd6d404
License	None
Optimisation	Yes with 200 Runs
Total Supply	1,000,000 SQUIBONK
Decimals	18

Creation/Audit

Contract Deployed	10.04.2024
Audit Created	10.04.2024

Contract Function Analysis

 Pass
  Attention Item
  Risky Item

■ Pass
 ■ Attention
 ■ Risk

Contract Verified		The contract source code is uploaded to blockchain explorer and is open source, so everybody can read it.
Contract Ownership		0x00 Sometimes referred to as the "zero address" or "dead address" and is not owned by anyone.
Buy Tax	8 %	Shows the taxes for purchase transactions. Above 10% may be considered a high tax rate. More than 50% tax rate means may not be tradable. Fee can be set!
Sell Tax	8 %	Shows the taxes for sell transactions. Above 10% may be considered a high tax rate. More than 50% tax rate means may not be tradable. Fee can be set!
Honeypot Analyse		Holder is able to buy and sell. If honeypot: The contract blocks sell transfer from holder wallet. Multiple events may cause honeypot. Trading disabled, extremely high tax
Liquidity Status		Liquidity status on 10.04.2024 Lp Locked: 97% for 90 days on PinkSale
Trading Disable Functions		No Trading suspendable function found. If a suspendable code is included, the token maybe neither be bought or sold (honeypot risk). If contract is renounced this function can't be used
Set Fees function	 max 25%	Fee Setting function found. Contract renounced, function can not be triggered by owner. The contract owner may contain the authority to modify the transaction tax. If the transaction tax is increased to more than 49%, the tokens may not be able to be traded (honeypot risk).
Proxy Contract		Not a Proxy contract.
Mint Function		No Mint Function detected Mint function is transparent or non-existent. Hidden mint functions may increase the amount of tokens in circulation and effect the price of the token. Owner can mint new tokens and sell.

Balance Modifier Function		<p>No Balance Modifier function found.</p> <p>If there is a function for this, the contract owner can have the authority to modify the balance of tokens at other addresses. For example revoke the bought tokens from the holders wallet. Common form of scam: You buy the token, but it's disappearing from your wallet.</p>
Blacklist Function		<p>Blacklist Setting function found. Exclude wallets from receiving dividends only. No Blacklist from trading. Contract renounced, function can not be triggered by owner.</p> <p>If there is a blacklist, some addresses may not be able to trade normally. Example: you buy the token and right after your Wallet getting blacklisted. Like so you will be unable to sell. Honeypot Risk.</p>
Whitelist Function		<p>Whitelist Setting function found. Contract renounced, function can not be triggered by owner.</p> <p>If there is a function for this Developer can set zero fee or no max wallet size for addresses (for example team wallets can trade without fee. Can cause farming)</p>
Hidden Owner Analysis		<p>No Hidden or multi owner with authorisation</p> <p>For contract with a hidden owner, developer can still manipulate the contract even if the ownership has been abandoned.</p>
Retrieve Ownership Function		<p>No Functions found which can retrieve ownership of the contract.</p> <p>If this function exists, it is possible for the project owner to regain ownership even after relinquishing it. Also known as fake renounce.</p>
Self Destruct Function		<p>No Self Destruct function found.</p> <p>If this function exists and is triggered, the contract will be destroyed, all functions will be unavailable, and all related assets will be erased.</p>
Specific Tax Changing Function		<p>No Specific Tax Changing Functions found.</p> <p>If it exists, the contract owner may set a very outrageous tax rate for assigned address to block it from trading. Can assign all wallets at once!</p>
Trading Cooldown Function		<p>No Trading Cooldown Function found. If there is a trading cooldown function, the user will not be able to sell the token within a certain time or block after buying. Like a temporary honeypot.</p>
Max Transaction and Holding Modify Function		<p>No Max Transaction and Holding Modify function found.</p> <p>If there is a function for this, the maximum trading amount or maximum position can be modified. Can cause honeypot</p>
Transaction Limiting Function		<p>No Transaction Limiter Function Found.</p> <p>The number of overall token transactions may be limited (honeypot risk)</p>

Following detected contract functions serve as informational purposes about the contract. The owner has no more authorisation to trigger the following functions.

⚠ Set Fee (25% Max)

Contract renounced, function can not be triggered by owner.

The contract owner may contain the authority to modify the transaction tax. If the transaction tax is increased to more than 49%, the tokens may not be able to be traded (honeypot risk).

```

447
ftrace | funcSig
225 function rewardsFeesSetup(uint16 _buyFee!, uint16 _sellFee!, uint16 _transferFee!) public onlyOwner {
226     totalFees[0] = totalFees[0] - rewardsFees[0] + _buyFee!;
227     totalFees[1] = totalFees[1] - rewardsFees[1] + _sellFee!;
228     totalFees[2] = totalFees[2] - rewardsFees[2] + _transferFee!;
229     require(totalFees[0] <= 2500 && totalFees[1] <= 2500 && totalFees[2] <= 2500, "TaxesDefaultRouter: Cannot exceed max total fee of 25%");
230
231     rewardsFees = [_buyFee!, _sellFee!, _transferFee!];
  
```

```

447
ftrace | funcSig
195 function liquidityFeesSetup(uint16 _buyFee!, uint16 _sellFee!, uint16 _transferFee!) public onlyOwner {
196     totalFees[0] = totalFees[0] - liquidityFees[0] + _buyFee!;
197     totalFees[1] = totalFees[1] - liquidityFees[1] + _sellFee!;
198     totalFees[2] = totalFees[2] - liquidityFees[2] + _transferFee!;
199     require(totalFees[0] <= 2500 && totalFees[1] <= 2500 && totalFees[2] <= 2500, "TaxesDefaultRouter: Cannot exceed max total fee of 25%");
200
201     liquidityFees = [_buyFee!, _sellFee!, _transferFee!];
202
203     emit liquidityFeesUpdated(_buyFee!, _sellFee!, _transferFee!);
204 }
  
```

```

ftrace | funcSig
150 function squibonkFeesSetup(uint16 _buyFee!, uint16 _sellFee!, uint16 _transferFee!) public onlyOwner {
151     totalFees[0] = totalFees[0] - squibonkFees[0] + _buyFee!;
152     totalFees[1] = totalFees[1] - squibonkFees[1] + _sellFee!;
153     totalFees[2] = totalFees[2] - squibonkFees[2] + _transferFee!;
154     require(totalFees[0] <= 2500 && totalFees[1] <= 2500 && totalFees[2] <= 2500, "TaxesDefaultRouter: Cannot exceed max total fee of 25%");
155
156     squibonkFees = [_buyFee!, _sellFee!, _transferFee!];
157
158     emit squibonkFeesUpdated(_buyFee!, _sellFee!, _transferFee!);
159 }
  
```

⚠ Whitelist [Set exclud wallets]

Contract renounced, function can not be triggered by owner.

If there is a function for this Developer can set zero fee or no max wallet size for addresses (for example team wallets can trade without fee. Can cause farming)

```
247 | ftrace | funcSig
248 | function excludeFromFees(address account!, bool isExcluded!) public onlyOwner {
249 | |   isExcludedFromFees[account!] = isExcluded!;
250 | |
251 | |   emit ExcludeFromFees(account!, isExcluded!);
252 | | }
253 |
```

⚠ Blacklist Setting function found. Exclude wallets from receiving dividends only. No Blacklist from trading.

Contract renounced, function can not be triggered by owner.

```
217 | ftrace | funcSig
218 | function excludeFromDividends(address account!, bool isExcluded!) external onlyOwner {
219 | |   _excludeFromDividends(account!, isExcluded!);
220 | | }
221 | ftrace | funcSig
222 | function _excludeFromDividends(address account!, bool isExcluded!) internal override {
223 | |   dividendTracker.excludeFromDividends(account!, balanceOf(account!), isExcluded!);
224 | | }
```

Contract Security

Total Findings: 8

■ High 0

■ Medium 1

■ Low 6

■ Info 1

■ **High Severity Issues:** High possibility to cause problems, need to be resolved.

■ **Medium Severity Issue:** Will likely cause problems, recommended to resolve.

■ **Low Severity Issues:** Won't cause problems, but for improvement purposes could be adjusted.

■ **Informational Severity Issues:** Not harmful in any way, information for the developer team.

Contract Security

Detected High and Medium Severity Vulnerability Description.

⚠️ Approve of front running attack. Also known as Sandwich Bot attack. (2 Item)

Item: 1	Location:	Erc20.sol Line 136-140	Severity:	Low
---------	-----------	------------------------	-----------	-----

Function	<p>The approve() method overrides current allowance regardless of whether the spender already used it or not, so there is no way to increase or decrease allowance by a certain value atomically unless the token owner is a smart contract, not an account.</p> <p>This can be abused by a token receiver when they try to withdraw certain tokens from the sender's account. Meanwhile, if the sender decides to change the amount and sends another approve transaction, the receiver can notice this transaction before it's mined and can extract tokens from both the transactions, therefore, ending up with tokens from both the transactions. This is a front-running attack affecting the ERC20 Approve function. The function approve can be front-run by abusing the _approve function.</p>
Remediation	<ol style="list-style-type: none"> 1.Introduce mechanisms that limit the maximum acceptable gas price for transactions. This can help prevent front-runners from drastically increasing the gas fees to prioritize their transactions. 2.Use transaction taxes to prevent against front-run attack

```

135 |
136 | function approve(address spender!, uint256 amount!) public virtual override returns (bool) {
137 |     address owner = _msgSender();
138 |     _approve(owner, spender!, amount!);
139 |     return true;
140 | }
  
```

Item: 2	Location:	Erc250.sol Line 324-332	Severity:	■ Low
---------	-----------	----------------------------	-----------	--

Function	<p>The <code>_spendAllowance()</code> method overrides current allowance regardless of whether the spender already used it or not, so there is no way to increase or decrease allowance by a certain value atomically unless the token owner is a smart contract, not an account.</p> <p>This can be abused by a token receiver when they try to withdraw certain tokens from the sender's account. Meanwhile, if the sender decides to change the amount and sends another approve transaction, the receiver can notice this transaction before it's mined and can extract tokens from both the transactions, therefore, ending up with tokens from both the transactions. This is a front-running attack affecting the ERC20 Approve function. The function approve can be front-run by abusing the <code>_approve</code> function.</p>
Remediation	<ol style="list-style-type: none"> 1. Introduce mechanisms that limit the maximum acceptable gas price for transactions. This can help prevent front-runners from drastically increasing the gas fees to prioritize their transactions. 2. Use transaction taxes to prevent against front-run attack

```

324  ftrace | funcSig
325  function _spendAllowance(address owner!, address spender!, uint256 amount!) internal virtual {
326      uint256 currentAllowance = allowance(owner!, spender!);
327      if (currentAllowance != type(uint256).max) {
328          require(currentAllowance >= amount!, "ERC20: insufficient allowance");
329          unchecked {
330              _approve(owner!, spender!, currentAllowance - amount!);
331          }
332      }
333  }
  
```

⚠ Existence of public burn function. (1 Item)

Item: 1	Location:	Erc20Burnable.sol Line 35-38	Severity:	Medium
---------	-----------	---------------------------------	-----------	--------

Function	The contract was found to be using public or an external burn function. The function was missing access control to prevent another user from burning their tokens. Also, the burn function was found to be using a different address than msg.sender.
Remediation	<ol style="list-style-type: none"> 1. Ensure that initialization functions can only be called once and only by authorized entities. 2. Implement least-privilege roles using libraries like OpenZeppelin's Access Control. 3. Add proper access control modifiers to sensitive functions, such as onlyOwner or custom roles.

```

35  ftrace | funcSig
36  function burnFrom(address account!, uint256 amount!) public virtual {
37      _spendAllowance(account!, _msgSender(), amount!);
38      _burn(account!, amount!);
39  }

```

Audit Scope

Audit Method.

Our smart contract audit is an extensive methodical examination and analysis of the smart contract's code that is used to interact with the blockchain. Goal: discover errors, issues and security vulnerabilities in the code. Findings getting reported and improvements getting suggested.

Automatic and Manual Review

We are using automated tools to scan functions and weaknesses of the contract. Transfers, integer over-undeflow checks such as all CWE events.

Tools we use:

Visual Studio Code

CWE

SWC

Solidity Scan

SVD

In manual code review our auditor looking at source code and performing line by line examination. This method helps to clarify developer's coding decisions and business logic.
