## Global Disclaimer

This document serves as a disclaimer for the crypto smart contract audit conducted by Skeleton Ecosystem. The purpose of the audit was to review the codebase of the smart contracts for potential vulnerabilities and issues. It is important to note the following:

**Limited Scope:** The audit is based on the code and information available up to the audit completion date. It does not cover external factors, system interactions, or changes made after the audit. The audit itself can not guarantee 100% safety and can not detect common scam methods like farming and developer sell-out.

**No Guarantee of Security:** While we have taken reasonable steps to identify vulnerabilities, it is impossible to guarantee the complete absence of security risks or issues. The audit report provides an assessment of the contract's security as of the audit date.

**Continued Development:** Smart contracts and blockchain technology are evolving fields. Updates, forks, or changes to the contract post-audit may introduce new risks that were not present during the audit.

**Third-party Code:** If the smart contract relies on third-party libraries or code, those components were not thoroughly audited unless explicitly stated. Security of these dependencies is the responsibility of their respective developers.

**Non-Exhaustive Testing:** The audit involved automated analysis, manual review, and testing under controlled conditions. It is possible that certain vulnerabilities or issues may not have been identified.

**Risk Evaluation:** The audit report includes a risk assessment for identified vulnerabilities. It is recommended that the development team carefully reviews and addresses these risks to mitigate potential exploits.

**Not Financial Advice:** This audit report is not intended as financial or investment advice. Decisions regarding the use, deployment, or investment in the smart contract should be made based on a comprehensive assessment of the associated risks.

By accessing and using this audit report, you acknowledge and agree to the limitations outlined above. Skeleton Ecosystem and its auditors shall not be held liable for any direct or indirect damages resulting from the use of the audit report or the smart contract itself.

Please consult with legal, technical, and financial professionals before making any decisions related to the smart contract.

## Overview

Contract Name	Hungary2k24
Ticker/Simbol	HU2K24
Blockchain	Base ERC20
Contract Address	0x6cD70dA5D80d9E9D2F995fC92b440503C7A73e7d
Creator Address	0x031384a4dc8e1ac88Adca62Ab43AfeFA363C48a0
Current Owner Address	0x00
Contract Explorer	<a href="https://etherscan.io/address/0x98d0F36d4b8431B87EDCA663Cd1eB8B972bAfEE1#code">https://etherscan.io/address/0x98d0F36d4b8431B87EDCA663Cd1eB8B972bAfEE1#code</a>
Compiler Version	v0.8.19+commit.7dd6d404
License	Unlicense
Optimisation	Yes with 200 Runs
Total Supply	100,000,000,000,000 HU2K24
Decimals	18

## Creation/Audit

Contract Deployed	13.06.2024
Audit Created	15.06.2024
Audit Update	V 1.0

## Contract Function Analysis

 Pass
  Attention Item
  Risky Item

■ Pass  
 ■ Attention  
 ■ Risk

Contract Verified		The contract source code is uploaded to blockchain explorer and is open source, so everybody can read it.
Contract Ownership		0x00 Sometimes referred to as the "zero address" or "dead address" and is not owned by anyone.
Buy Tax	0 %	Shows the taxes for purchase transactions. Above 10% may be considered a high tax rate. More than 50% tax rate means may not be tradable. Fee can be set!
Sell Tax	0 %	Shows the taxes for sell transactions. Above 10% may be considered a high tax rate. More than 50% tax rate means may not be tradable. Fee can be set!
Honeypot Analyse		Holder is able to buy and sell. If honeypot: The contract blocks sell transfer from holder wallet. Multiple events may cause honeypot. Trading disabled, extremely high tax
Liquidity Status		Liquidity status on 15.06.2024 99.00% UNCX for 60 days.
Trading Disable Functions		No Trading suspendable function foundIf a suspendable code is included, the token maybe neither be bought or sold (honeypot risk). If contract is renounced this function can't be used
Set Fees function max 10%		Fee Setting function found. <b>Contract renounced, function can not be triggered by owner.</b>  The contract owner may contain the authority to modify the transaction tax. If the transaction tax is increased to more than 49%, the tokens may not be able to be traded (honeypot risk).
Proxy Contract		Not a Proxy contract.
Mint Function		No Mint Function detected  Mint function is transparent or non-existent. Hidden mint functions may increase the amount of tokens in circulation and effect the price of the token. Owner can mint new tokens and sell.

Balance Modifier Function		<p>No Balance Modifier function found.</p> <p>If there is a function for this, the contract owner can have the authority to modify the balance of tokens at other addresses. For example revoke the bought tokens from the holders wallet. Common form of scam: You buy the token, but it's disappearing from your wallet.</p>
Blacklist Function		<p>No Blacklist Setting function found.</p> <p>If there is a blacklist, some addresses may not be able to trade normally. Example: you buy the token and right after your Wallet getting blacklisted. Like so you will be unable to sell. Honeypot Risk.</p>
Whitelist Function		<p>Whitelist Setting function found.</p> <p><b>Contract renounced, function can not be triggered by owner.</b></p> <p>If there is a function for this Developer can set zero fee or no max wallet size for addresses (for example team wallets can trade without fee. Can cause farming)</p>
Hidden Owner Analysis		<p>No Hidden or multi owner with authorisation</p> <p>For contract with a hidden owner, developer can still manipulate the contract even if the ownership has been abandoned.</p>
Retrieve Ownership Function		<p>No Functions found which can retrieve ownership of the contract.</p> <p>If this function exists, it is possible for the project owner to regain ownership even after relinquishing it. Also known as fake renounce.</p>
Self Destruct Function		<p>No Self Destruct function found.</p> <p>If this function exists and is triggered, the contract will be destroyed, all functions will be unavailable, and all related assets will be erased.</p>
Specific Tax Changing Function		<p>No Specific Tax Changing Functions found.</p> <p>If it exists, the contract owner may set a very outrageous tax rate for assigned address to block it from trading. Can assign all wallets at once!</p>
Trading Cooldown Function		<p>No Trading Cooldown Function found. If there is a trading cooldown function, the user will not be able to sell the token within a certain time or block after buying. Like a temporary honeypot.</p>
Max Transaction and Holding Modify Function		<p>Max Transaction and Holding Modify function found. Toggle remove limits triggered before renounce.</p> <p>Max wallet and max transfer = Totalsupply</p> <p><b>Contract renounced, function can not be triggered by owner.</b></p> <p>If there is a function for this, the maximum trading amount or maximum position can be modified. Can cause honeypot</p>
Transaction Limiting Function		<p>No Transaction Limiter Function Found.</p> <p>The number of overall token transactions may be limited (honeypot risk)</p>

## Details of Risk - Attention Items

### Removing Risk of contract function based on renounced ownership

Transaction Receipt Event Logs

2: newOwner Dec → 0x00

**Data** 0x

Following detected contract functions serve as informational purposes about the contract. The owner has no more authorisation to trigger functions.

#### ⚠ Set Fee (Max 10%)

Contract renounced, function can not be triggered by owner.

The contract owner may contain the authority to modify the transaction tax. If the transaction tax is increased to more than 49%, the tokens may not be able to be traded (honeypot risk).

```

424 |
425 | ftrace | funcSig
426 | function SetFee(uint256 _BuyFee!, uint256 _SellFee!) public onlyOwner {
427 |     require(_BuyFee! <= 10, "Buy Fee too high");
428 |     marketingBuyFee = _BuyFee!;
429 |     require(_SellFee! <= 10, "Sell Fee too high");
430 |     marketingSellFee = _SellFee!;
431 | }
  
```

#### ⚠ Whitelist (Set Zero Fee wallets)

Contract renounced, function can not be triggered by owner.

If there is a function for this Developer can set zero fee or no max wallet size for addresses (for example team wallets can trade without fee. Can cause farming)

```

436   function excludeFromFees(address account!, bool value!) public onlyOwner {
437       _isExcludedFromFees[account!] = value!;
438       emit ExcludeFromFees(account!, value!);
439   }
440

```

## ⚠ Max Transaction and Holding Modify Function

Contract renounced, function can not be triggered by owner.

If there is a function for this, the maximum trading amount or maximum position can be modified. Can cause honeypot

```

409   function setMaxWalletAndMaxTransaction(
410       uint256 _maxTransaction!,
411       uint256 _maxWallet!
412   ) public onlyOwner {
413       require(
414         _maxTransaction! >= ((totalSupply() * 5) / 1000),
415         "ERC20: Cannot set maxTxn lower than 0.5%"
416       );
417       require(
418         _maxWallet! >= ((totalSupply() * 5) / 1000),
419         "ERC20: Cannot set maxWallet lower than 0.5%"
420       );
421       maxTransactionAmount = _maxTransaction!;
422       maxWalletToken = _maxWallet!;
423   }

```

Total Findings: 6

■ High 0

■ Medium 0

■ Low 3

■ Info 3

■ **High Severity Issues:** High possibility to cause problems, need to be resolved.

■ **Medium Severity Issue:** Will likely cause problems, recommended to resolve.

■ **Low Severity Issues:** Won't cause problems, but for improvement purposes could be adjusted.

■ **Informational Severity Issues:** Not harmful in any way, information for the developer team.

## Contract Security

### List of Found Issues

 **High severity Issues: (0)**

 **Medium severity issues: (0)**

 **Low severity issues: (3)**

- Missing Eevents
- Approve Front Running Attack (Sandwich Bots)
- Outdated Compiler Version

 **Informational severity issues: (3)**

- Public Functions Should be Declared External
- State Variables Should be Declared Constant
- Precision Loss During Division By Large Numbers

## Contract Weakness Classisication

THE SMART CONTRACT WEAKNESS CLASSIFICATION REGISTRY (SWC REGISTRY) IS AN IMPLEMENTATION OF THE WEAKNESS CLASSIFICATION SCHEME PROPOSED IN EIP-1470. IT IS LOOSELY ALIGNED TO THE TERMINOLOGIES AND STRUCTURE USED IN THE COMMON WEAKNESS ENUMERATION (CWE) WHILE OVERLAYING A WIDE RANGE OF WEAKNESS VARIANTS THAT ARE

ID	Description	AI	Manual	Result
SWC-100	Function Default Visibility	Passed	Passed	Passed
SWC-101	Integer Overflow and Underflow	Passed	Passed	Passed
SWC-102	Outdated Compiler Version	low	low	low
SWC-103	Floating Pragma	low	Passed	Passed
SWC-104	Unchecked Call Return Value	Passed	Passed	Passed
SWC-105	Unprotected Ether Withdrawal	Passed	Passed	Passed
SWC-106	Unprotected SELFDESTRUCT Instruction	Passed	Passed	Passed
SWC-107	Reentrancy	Passed	Passed	Passed
SWC-108	State Variable Default Visibility	Passed	Passed	Passed

## Detected High and Medium Severity Vulnerability Description.

### Outdated Compiler Version

Item: 1	Location:	Line 10	Severity:  Low
---------	-----------	---------	---

<b>Function</b>	Using an outdated compiler version can be problematic especially if there are publicly disclosed bugs and issues that affect the current compiler version. The following outdated versions were detected: /hungary2k24.sol - 0.8.19
<b>Remedation</b>	It is recommended to use a recent version of the Solidity compiler that should not be the most recent version, and it should not be an outdated version as well. Using very old versions of Solidity prevents the benefits of bug fixes and newer security checks. Consider using the solidity version v0.8.25, which patches most solidity vulnerabilities.

⚠️ Approve of front running attack. Also known as Sandwich Bot attack. (2 Item)

Item: 1	Location:	Line 80-83	Severity: <span style="color: green;">■</span> Low
---------	-----------	------------	--

<b>Function</b>	<p>The <b>approve()</b> method overrides current allowance regardless of whether the spender already used it or not, so there is no way to increase or decrease allowance by a certain value atomically unless the token owner is a smart contract, not an account.</p> <p>This can be abused by a token receiver when they try to withdraw certain tokens from the sender's account. Meanwhile, if the sender decides to change the amount and sends another approve transaction, the receiver can notice this transaction before it's mined and can extract tokens from both the transactions, therefore, ending up with tokens from both the transactions. This is a front-running attack affecting the ERC20 Approve function. The function approve can be front-run by abusing the <code>_approve</code> function.</p>
<b>Remediation</b>	<p>1.Introduce mechanisms that limit the maximum acceptable gas price for transactions. This can help prevent front-runners from drastically increasing the gas fees to prioritize their transactions.</p> <p>2.Use transaction taxes to prevent against front-run attack</p>

```

80  ftrace | funcSig
81  function approve(address spender1, uint256 amount1) public virtual override returns (bool) {
82      _approve(_msgSender(), spender1, amount1);
83      return true;
84  }

```

Item: 2	Location:	Line 85-99	Severity: <span style="color: green;">■</span> Low
---------	-----------	------------	--

<b>Function</b>	<p>The <b>TransferFrom()</b> method overrides current allowance regardless of whether the spender already used it or not, so there is no way to increase or decrease allowance by a certain value atomically unless the token owner is a smart contract, not an account.</p> <p>This can be abused by a token receiver when they try to withdraw certain tokens from the sender's account. Meanwhile, if the sender decides to change the amount and sends another approve transaction, the receiver can notice this transaction before it's mined and can extract tokens from both the transactions, therefore, ending up with tokens from both the transactions. This is a front-running attack affecting the ERC20 Approve function. The function approve can be front-run by abusing the _approve function.</p>
<b>Remedation</b>	<ol style="list-style-type: none"> <li>1.Introduce mechanisms that limit the maximum acceptable gas price for transactions. This can help prevent front-runners from drastically increasing the gas fees to prioritize their transactions.</li> <li>2.Use transaction taxes to prevent against front-run attack</li> </ol>

```

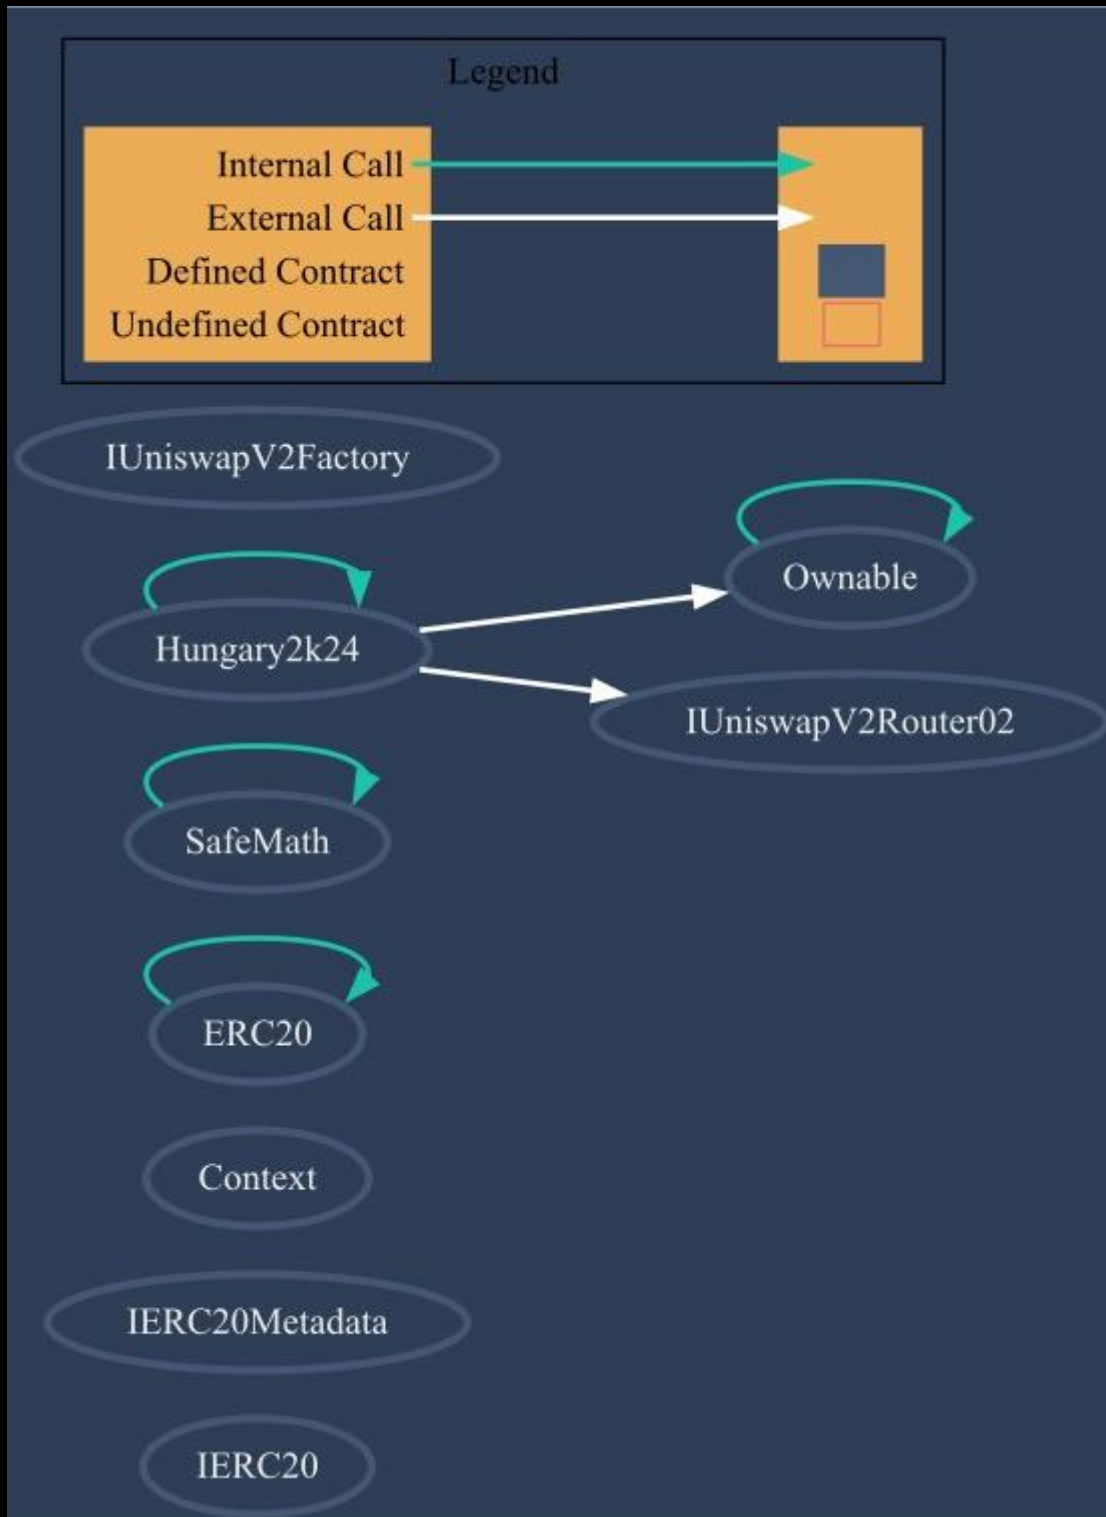

85  ftrace | funcSig
86  function transferFrom(
87      address sender!,
88      address recipient!,
89      uint256 amount!
90  ) public virtual override returns (bool) {
91      _transfer(sender!, recipient!, amount!);
92
93      uint256 currentAllowance = _allowances[sender!][_msgSender()];
94      require(currentAllowance >= amount!, "ERC20: transfer amount exceeds allowance");
95      unchecked {
96          _approve(sender!, _msgSender(), currentAllowance - amount!);
97      }
98
99      return true;
100  }
  
```

## Audit Scope

### Audit Method.

Our smart contract audit is an extensive methodical examination and analysis of the smart contract's code that is used to interact with the blockchain. Goal: discover errors, issues and security vulnerabilities in the code. Findings getting reported and improvements getting suggested.

### Automatic and Manual Review

We are using automated tools to scan functions and weaknesses of the contract. Transfers, integer over-undeflow checks such as all CWE events.

### Tools we use:

Visual Studio Code

CWE

SWC

Solidity Scan

SVD

In manual code review our auditor looking at source code and performing line by line examination. This method helps to clarify developer's coding decisions and business logic.
