Global Disclaimer

This document serves as a disclaimer for the crypto smart contract audit conducted by Skeleton Ecosystem. The purpose of the audit was to review the codebase of the smart contracts for potential vulnerabilities and issues. It is important to note the following:

Limited Scope: The audit is based on the code and information available up to the audit completion date. It does not cover external factors, system interactions, or changes made after the audit. The audit itself can not guarantee 100% safaty and can not detect common scam methods like farming and developer sell-out.

No Guarantee of Security: While we have taken reasonable steps to identify vulnerabilities, it is impossible to guarantee the complete absence of security risks or issues. The audit report provides an assessment of the contract's security as of the audit date.

Continued Development: Smart contracts and blockchain technology are evolving fields. Updates, forks, or changes to the contract post-audit may introduce new risks that were not present during the audit.

Third-party Code: If the smart contract relies on third-party libraries or code, those components were not thoroughly audited unless explicitly stated. Security of these dependencies is the responsibility of their respective developers.

Non-Exhaustive Testing: The audit involved automated analysis, manual review, and testing under controlled conditions. It is possible that certain vulnerabilities or issues may not have been identified.

Risk Evaluation: The audit report includes a risk assessment for identified vulnerabilities. It is recommended that the development team carefully reviews and addresses these risks to mitigate potential exploits.

Not Financial Advice: This audit report is not intended as financial or investment advice. Decisions regarding the use, deployment, or investment in the smart contract should be made based on a comprehensive assessment of the associated risks.

By accessing and using this audit report, you acknowledge and agree to the limitations outlined above. Skeleton Ecosystem and its auditors shall not be held liable for any direct or indirect damages resulting from the use of the audit report or the smart contract itself.

Please consult with legal, technical, and financial professionals before making any decisions related to the smart contract.

Overview

Contract Name	FLOKI 2024
Ticker/Simbol	FLOKI 2024
Blockchain	Binance Smart Chain BEP20
Contract Address	0xa7900F818F9aC3b9D3fB7E43ad2b33ce3a6A12c5
Creator Address	0xEc180521A918d011057F4019c0e38c63234D8bD2
Current Owner Address	0x000000000000000000000000000000000000dead
Contract Explorer	https://bscscan.com/token/0xa7900f818f9ac3b9d3fb7e43ad2b33ce3a6a12c5#code
Compiler Version	v0.8.18+commit.87f61d96
License	None
Optimisation	No with 200 Runs
Total Supply	100,000,000,000,000,000 FLOKI
Decimals	9
Creation/Audit

|	
Contract Deployed	12 Nov 2023
Audit Created	29 Nov 2023
Audit Update	V 1.0

Contract Function Analysis

✅ Pass   ⚠️ Attention Item   🔺 Risky Item

🟩 Pass
🟨 Attention
🟥 Risk

0   0   19

Contract Verified	✅	The contract source code is uploaded to blockchain explorer and is open source, so everybody can read it.
Contract Ownership		Renounced 0x000000000000000000000000000000000000dead
Buy Tax	5 %	Shows the taxes for purchase transactions. Above 10% may be considered a high tax rate. More than 50% tax rate means may not be tradable. Fee can be set!
Sell Tax	5 %	Shows the taxes for sell transactions. Above 10% may be considered a high tax rate. More than 50% tax rate means may not be tradable. Fee can be set!
Honeypot Analyse	✅	Holder is able to buy and sell. If honeypot: The contract blocks sell transfer from holder wallet. Multiple events may cause honeypot. Trading disabled, extremely high tax
Liqudity Status	✅	LP Lock Status on 29.11.2023: 100.00% Pinklock for 400 days.
Trading Disable Functions	✅	No Trading suspendable function found. If a suspendable code is included, the token maybe neither be bought or sold (honeypot risk). If contract is renounced this function can't be used
Set Fees function	✅	No Fee Setting function found. The contract owner may contain the authority to modify the transaction tax. If the transaction tax is increased to more than 49%, the tokens may not be able to be traded (honeypot risk).
Proxy Contract	✅	Not a proxy contract!
Mint Function	✅	No Mint Function detected Mint function is transparent or non-existent. Hidden mint functions may increase the amount of tokens in circulation and effect the price of the token. Owner can mint new tokens and sell.

SKELETON ECOSYSTEM
SMART CONTRACT AUDIT REPORT

Balance Modifier Function	✅	No Balance Modifier function found. If there is a function for this, the contract owner can have the authority to modify the balance of tokens at other addresses. For example revoke the bought tokens from the holders wallet. Common form of scam: You buy the token, but it's disappearing from your wallet.
Blacklist Function	✅	No Blacklist Setting function found. If there is a blacklist, some addresses may not be able to trade normally. Example: you buy the token and right after your Wallet getting blacklisted. Like so you will be unable to sell. Honeypot Risk.
Whitelist Function	⚠️✅	Whitelist Setting function found, but contract is renounced, this function can not be triggered. If there is a function for this Developer can set zero fee or no max wallet size for adresses (for example team wallets can trade without fee. Can cause farming)
Hidden Owner Analysis	✅	No Hidden or multi owner with authorisation For contract with a hidden owner, developer can still manipulate the contract even if the ownership has been abandoned.
Retrieve Ownership Function	✅	No Functions found which can retrieve ownership of the contract. If this function exists, it is possible for the project owner to regain ownership even after relinquishing it. Also known as fake renounce.
Self Destruct Function	✅	No Self Destruct function found. If this function exists and is triggered, the contract will be destroyed, all functions will be unavailable, and all related assets will be erased.
Specific Tax Changing Function	✅	No Specific Tax Changing Functions found. If it exists, the contract owner may set a very outrageous tax rate for assigned address to block it from trading. Can assign all wallets at once!
Trading Cooldown Function	✅	No Trading Cooldown Function found. If there is a trading cooldown function, the user will not be able to sell the token within a certain time or block after buying. Like a temporary honeypot.
Max Transaction and Holding Modify Function	✅	No Max Transaction and Holding Modify function found. If there is a function for this, the maximum trading amount or maximum position can be modified. Can cause honeypot
Transaction Limiting Function	✅	No Transaction Limiter Function Found. The number of overall token transactions may be limited (honeypot risk)

Details of Risk - Attention Items

Skeleton Ecosystem 6

⚠️ Whitelist Function

Risk Removed → Renounced Contract!

If there is a function for this, Developer can set zero fee or no max wallet size
for adresses (for example team wallets can trade without fee. Can cause farming)

```
         ftrace | funcSig
311      function excludeFromFee(address account) public onlyOwner {
312          _isExcludedFromFee[account] = true;
313      }
314
         ftrace | funcSig
315      function includeInFee(address account) public onlyOwner {
316          _isExcludedFromFee[account] = false;
317      }
318
         ftrace | funcSig
319      function isExcludedFromFee(address account) public view returns (bool) {
320          return _isExcludedFromFee[account];
321      }
```

Contract Security

Total Findings: 8

🟥 High 0

🟨 Medium 2

🟩 Low 4

🟪 Info 2

🟥 **High Severity Issues:** High possibility to cause problems, need to be resolved.

🟨 **Medium Severity Issue:** Will likely cause problems, recommended to resolve.

🟩 **Low Severity Issues:** Won't cause problems, but for improvement purposes could be adjusted.

🟪 **Informational Severity Issues:** Not harmful in any way, information for the developer team.

Contract Security

List of Found Issues

High severity Issues: (0)

Medium severity issues: (2)

- Incorrect Acces Control
- Unchecked Array Lenght

Low severity issues: (4)

- Missing Events
- Long Number Literals
- Floating Pragma
- Outdated Compiler Version

Informational severity issues: (2)

- Public Functions Should be Declared External (gas)
- Costly Loop Operations (gas)

Contract Weakness Classisication

THE SMART CONTRACT WEAKNESS CLASSIFICATION REGISTRY (SWC REGISTRY) IS AN IMPLEMENTATION OF THE WEAKNESS CLASSIFICATION SCHEME PROPOSED IN EIP-1470. IT IS LOOSELY ALIGNED TO THE TERMINOLOGIES AND STRUCTURE USED IN THE COMMON WEAKNESS ENUMERATION (CWE) WHILE OVERLAYING A WIDE RANGE OF WEAKNESS VARIANTS THAT ARE SPECIFIC TO SMART CONTRACTS.

ID	Description	AI	Manual	Result

SKELETON ECOSYSTEM
SMART CONTRACT AUDIT REPORT

Detected High and Medium Severity Vulnerability
Description.

⚠️ Incorrect Acces Control (2 Item)

Item: 1	Location:	Line 240-245		Severity:	🟨 Medium

Function	Access control plays an important role in segregation of privileges in smart contracts and other applications. If this is misconfigured or not properly validated on sensitive functions, it may lead to loss of funds, tokens and in some cases compromise of the smart contract. The contract FLOKI2024 is importing an access control library @openzeppelin/contracts/access/Ownable.sol but the function increaseAllowance is missing the modifier onlyOwner.
Remedation	It is recommended to go through the contract and observe the functions that are lacking an access control modifier. If they contain sensitive administrative actions, it is advised to add a suitable modifier to the same

```
240
    ftrace | funcSig
241    function increaseAllowance(address spender, uint256 addedValue) public returns (bool) {
242        _approve(_msgSender(), spender, _allowances[_msgSender()][spender] + addedValue);
243        return true;
244    }
245
```

Item: 2	Location:	Line 246-255	Severity:	▮Medium

Function	The contract FLOKI2024 is importing an access control library @openzeppelin/contracts/access/Ownable.sol but the function decreaseAllowance is missing the modifier onlyOwner.
Remediation	It is recommended to go through the contract and observe the functions that are lacking an access control modifier. If they contain sensitive administrative actions, it is advised to add a suitable modifier to the same

```
ftrace | funcSig
246  function decreaseAllowance(address spender↑, uint256 subtractedValue↑)
247      public
248      returns (bool)
249  {
250      uint256 currentAllowance = allowances[_msgSender()][spender↑];
251      require(currentAllowance >= subtractedValue↑, "BEP20: decreased allowance below zero");
252      _approve(_msgSender(), spender↑, currentAllowance - subtractedValue↑);
253
254      return true;
255  }
```

⚠️ Unchecked Array Lenght(2 Item)

| Item: 1	Location:	Line 300	Severity:	🟨 Medium
Item: 2	Location:	Line 518	Severity:	🟨 Medium

Function	Ethereum is a very resource-constrained environment. Prices per computational step are orders of magnitude higher than with centralized providers. Moreover, Ethereum miners impose a limit on the total number of Gas consumed in a block. If array.length is large enough, the function exceeds the block gas limit, and transactions calling it will never be confirmed. for (uint256 i = 0; i < array.length ; i++) { cosltyFunc(); } This becomes a security issue if an external actor influences array.length. E.g., if an array enumerates all registered addresses, an adversary can register many addresses, causing the problem described above. .
Remedation	Either explicitly or just due to normal operation, the number of iterations in a loop can grow beyond the block gas limit, which can cause the complete contract to be stalled at a certain point. Therefore, loops with a bigger or unknown number of steps should always be avoided.

```
299    require(_isExcluded[account], "Account is not excluded");
300    for (uint256 i = 0; i < _excluded.length; i++) {
301        if (_excluded[i] == account) {
```

```
ftrace | funcSig
517    function bulkExcludeFee(address[] memory accounts, bool state) external onlyOwner {
518        for (uint256 i = 0; i < accounts.length; i++) {
519            _isExcludedFromFee[accounts[i]] = state;
```

Audit Scope

Audit Method.

Our smart contract audit is an extensive methodical examination and analysis of the smart contract's code that is used to interact with the blockchain. Goal: discover errors, issues and security vulnaribilities in the code. Findings getting reported and improvements getting suggested.

Automatic and Manual Review
We are using automated tools to scan functions and weeknesses of the contract. Transfers, integer over-undeflow checks such as all CWE events.

Tools we use:
Visual Studio Code
CWE
SWC
Solidity Scan
SVD

In manual code review our auditor looking at source code and performing line by line examination. This method helps to clarify developer's coding decisions and business logic.
